need from this huge volume of data. For Chinese people, the language barrier is a formidable obstacle to joining and accessed,through the Internet all over the world. PC users need to be able to retrieve the information they the global conversation. They need cross-language information retrieval.

Our Mission

concentrate on the urgent need of the broad masses of Chinese PC users both on Chinese Input and the Internet Let computer can read, write and understand human's language is our long-term goal. So our mission is to knowledge acquisition automatically from natural language text, human-computer interaction directly through - oriented information retrieval and browsing. In the future, we will also want to explore new areas, such as analyze, generate and understand natural language text for various applications. At the moment, we will natural language, and multilingual machine translation.
